

The City of Surrey is delighted to be recognized by ITS Canada for its efforts towards improved data driven outcomes in transportation. The digitalization of its roadway electrical maintenance activities is an initiative to capture better data

using sustainable approaches. A System of Engagement was designed to collaborate with Surrey's electrical maintenance contractor incorporating the collection, real-time visualization, analysis, and storage of this corporate dataset. The tools leveraged Surrey's enterprise licence for ESRI's Software-as-a-Service and Platform-as-a-

Service suite of products and therefore did not incur any additional expenses to implement. Surrey staff are now empowered to make faster and better decisions, informed by data insights, to operate safer and reliable transportation infrastructure. Furthermore, improvements to the data available permit Surrey staff to use electrical maintenance funds more effectively resulting in cost savings for its citizens.
